

# woodland management

## what is it?

Woodland did just fine for millions of years before humans came along, so what's all this 'management' about? Well, the UK used to be completely covered in woodland, so if there was any damage in one area (due to wind, fire, insect attack, disease or flood), then it would quickly regenerate from the surrounding woodland. Nowadays, woodland only exists in pockets, so local damage could mean the end of that particular woodland for a generation. Also, woodland today is often planted, not natural, so that all the trees reach maturity at the same time, without any regeneration.

In nature, the occasional mature tree would fall, opening the canopy and letting light onto the forest floor, encouraging the germination of seeds for the next generation of trees. Humans can now manage woodland, copying natural processes, and harvesting timber and firewood at the same time. The basis for any management is the cyclical process of fell, plant, nurture, thin and fell again. The assessment of a woodland area, or the species choice for any new planting depends on the expected goals. It's important to keep in mind future requirements. We should be looking decades into the future, and sometimes beyond our own lifetimes. Timber felled now can be between 20 and 200 years old, and we should seek to replace growing stock at a level in excess of that being cut.

There are different systems of management, including rotation coppicing (see below), and

*one-hectare clearance, re-planted with oak, ash and alder; the tubes are for ease of maintenance (you can see where the trees are when weeding) and to prevent rabbit and vole damage.*

*lightweight, 8-wheel drive low-impact forwarder – so called because it forwards timber from the felling site out to the stack; this could also be done by horses – see resources.*

gradual thinning to produce mature high forest of valuable sawlogs in 200 years time. The re-stocking of felled areas and the selection of species is always vitally important though.

## what are the benefits?

With good management of a small woodland, we can actually improve on nature by producing more 'edge' habitat (or 'ecotone'). There is more biodiversity (number of species) where two habitats meet, for example grassland and woodland, than in each of those habitats themselves. A small woodland often contains trees all of the same age, so there is a canopy of the same height, casting a shadow that prevents ground flora or re-growth. A management regime consisting of felling, thinning and re-planting creates an edge ecosystem from high canopy right down to grass.

Management can also improve the health of individual trees, via thinning and the digging of drainage ditches.

Other benefits include:

- local, renewable production of building materials and firewood (reducing transport distances)
- reducing carbon emissions from building materials and heating fuel
- the planting of new woodland provides totally new habitats for wildlife
- opening paths through existing woods, and planting new ones improves amenities and awareness of the natural world

## what can I do?

Well, you don't have to own woodlands to learn about them – you'll appreciate a greater understanding of the woodlands in your area. Having said that, many people are buying small pockets of land to plant trees these days, or coming together with others to increase their buying power – plus numbers of people for tree planting. If you are looking to buy land, first contact a local land agent (as opposed to estate agent) – check your yellow pages. Agricultural land is around £8,000 per hectare on average in the UK, and you are allowed to plant trees on it. You might even be able to get a woodland creation grant from the Forestry Commission. The species you will plant will depend on the soil, topography, aspect and hydrology. Alternatively, you could volunteer to plant trees and manage woodland for organisations like the Woodland Trust or Trees for Life.

### producing firewood

Coppicing is probably the best way to produce firewood. This means cutting through the tree about 15cm above the ground, allowing the rootstock to re-shoot. This means that from then on the tree will have several stems, and this makes coppiced woodland easy to spot. Most broadleaf species will do it, but best is probably hazel and ash (and ash is excellent firewood, even when green). You don't even need a chainsaw for this job – a bowsaw is adequate.

Coppicing is done on a rotation – maybe 15 or 25 years (i.e. each tree will be coppiced every 15 or 25 years, and you coppice different trees every year). For space and water heating, plus cooking, you would need at least 10 tonnes of firewood per year. A hectare of woodland will produce around 3 tonnes of firewood per year this way, and so you'll need just over 3 hectares of forest for your needs. Most people would use wood only for some of their needs, however.

### producing timber

A newly-planted woodland will produce about 250 tonnes of timber per hectare in 50 years. If

*short-rotation coppice stools - notice that each tree has several stems; these trees were coppiced 15 years previously, and are ready for coppicing again.*

you don't know how to fell a mature tree, don't attempt it – get someone in who does or get training. To plank felled timber you could use a chainsaw in a jig (see Timber Trades Journal) or contact someone with a wood-mizer (mobile bandsaw) – see the Small Woods Association, or maybe the divisional rep of the Royal Forestry Society.

To sell your timber, you could try Ecolots, or approach local joiners.

## resources

- LILI provide a range of books and a course on woodland management
- *Woodlands: a practical handbook*, Elizabeth Agate, BTCV; excellent book
- *Woodland Management: a practical guide*, Chris Starr; both books available from LILI
- forestry.gov.uk - Forestry Commission
- woodland-trust.org.uk - Woodland Trust
- treesforlife.org.uk - Trees for Life
- britishhorseloggers.org - British Horse Loggers
- ttjonline.com - Timber Trades Journal
- smallwoods.org.uk - Small Woods Association
- rfs.org.uk - Royal Forestry Society
- ecolots.co.uk - Ecolots

Contact us or visit our website to find out more about our message, networks, factsheets, books, courses, products, services, magazines, links, forum, events and volunteering on organic farms. You can also become a Friend of LILI, receive our e-newsletter, and help us change the world.
